LIBRARY LEARNING

PROVISIONAL - EVIDENCE INCOMPLETE

TEST ONLY - SYNTHETIC SOURCES; NOT SCHOLARLY EVIDENCE

THE RESEARCH LOGIC

The scholarly problem. TEST ONLY: A routine account and an observed learning outcome answer different questions, yet a study can confuse their evidential roles.

Principal question. How should reported routines and observed outcomes be distinguished?

Proposed argument. TEST ONLY: distinguish related constructs under explicit inference boundaries

Narrow gap. TEST ONLY only a bounded measurement refinement could remain

Bounded to searched sources and contexts; TEST ONLY generated corpus; no real search or novelty

01 Argument step. TEST ONLY: Reported routines and observed learning outcomes warrant different kinds of claims. [S001, S002]

02 Argument step. TEST ONLY: Contextual opportunity is a plausible rival to an explanation centred only on learner routines. [S003, S004]

03 Argument step. TEST ONLY: A proposed design needs separate measures and disconfirming cases to connect the argument to evidence. [S005, S006]

THE AUTHORS' ORIGINAL EVIDENCE

10 selected of 10 target; 10 deeply reviewed works; 20 verified micro-excerpts.

01 Fictional001, 2024 [S001]

TEST ONLY: library learning evidence record 001

“reported routine cannot establish an observed outcome”

S001:result · Synthetic section: result

“no generalisability”

S001:limitation · Synthetic section: limitation

Author's argument. The illustrative authors distinguish accounts of study routines from independently documented outcomes; their argument concerns the kind of evidence needed for each construct. [a]

Method / mechanism. Their synthetic design separates an account-based survey from a hypothetical task observation, allowing comparison between what learners describe and what a task records. [b]

Evidence / reasoning. The worked example shows a measurement boundary: reported regularity alone does not establish an observed learning change. It reports no actual population estimate or tested effect. [c]

Boundary / counterpoint. The example contains no real participants or findings. Selection, recall and contextual opportunity remain rival explanations that an actual study would need to examine. [d]

Our inference. Use separate measures for reported routines and observed outcomes, and test contextual rivals before making an effectiveness claim. [a; interpretation]

Locators: a: Synthetic section: claim; b: Synthetic section: method; c: Synthetic section: result; d: Synthetic section: limitation

FROM EVIDENCE TO ARGUMENT

01 TEST ONLY: Reported routines and observed learning outcomes warrant different kinds of claims.

Source positions. S001: The illustrative authors distinguish accounts and observations.; S002: The illustrative authors also preserve inference limits and contextual rivals.

Critical comparison. Both sources distinguish accounts from observations; the second also limits what a reported routine can establish. [S001:claim, S002:claim, S001:result, S002:result]

Warrant. A measure of experience cannot alone establish an independently observed outcome.

Counterargument / limit. TEST ONLY: selection or opportunity can explain reported differences Synthetic only; no observed causal effects

Our synthesis. Separate the constructs before comparing their proposed relationship.

02 TEST ONLY: Contextual opportunity is a plausible rival to an explanation centred only on learner routines.

Source positions. S003: The illustrative authors distinguish accounts and observations.; S004: The illustrative authors also preserve inference limits and contextual rivals.

Critical comparison. The authors retain opportunity and selection as alternatives; neither synthetic source establishes which mechanism operates. [S003:claim, S004:claim, S003:result, S004:result]

Warrant. Different mechanisms may be compatible with the same reported pattern.

Counterargument / limit. TEST ONLY: selection or opportunity can explain reported differences Synthetic only; no observed causal effects

Our synthesis. Compare rival explanations and seek negative cases rather than assuming a routine caused an outcome.

03 TEST ONLY: A proposed design needs separate measures and disconfirming cases to connect the argument to evidence.

Source positions. S005: The illustrative authors distinguish accounts and observations.; S006: The illustrative authors also preserve inference limits and contextual rivals.

Critical comparison. One source separates instruments; the other cautions that a correspondence would still need inference and context checks. [S005:claim, S006:claim, S005:result, S006:result]

Warrant. Construct distinctions require matching observation and interpretation strategies.

Counterargument / limit. TEST ONLY: selection or opportunity can explain reported differences Synthetic only; no observed causal effects

Our synthesis. Use distinct measures or codes, then test the limits of the proposed explanation.

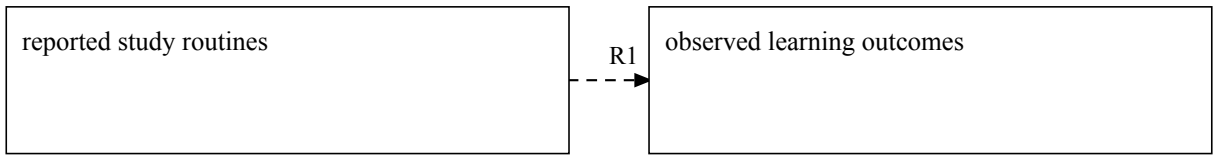

Critical counterpoint. S003 / S001: TEST ONLY: the contextual rival limits a routine-centred interpretation without claiming an empirical contradiction. [S003:counterpoint, S001:result]

Closest-study challenge. TEST ONLY existing conceptual distinctions may already answer the question

What remains. TEST ONLY only a bounded measurement refinement could remain

THEORETICAL / CONCEPTUAL FRAMEWORK

Primary explanatory lens. TEST ONLY evidence-boundary lens: TEST ONLY primary measurement lens [S001, S002]

Solid: source-grounded links. Dashed: proposed or sensitising links. Arrows express the stated analytical direction, not demonstrated causal effects.

reported study routines. Accounts of repeated activity; a perceived practice, not measured attainment TEST ONLY: reports are not observations [S001:claim, S002:method]

observed learning outcomes. Performance documented independently of a routine account TEST ONLY: reports are not observations [S001:claim, S002:method]

R1 (hypothesised). TEST ONLY: hypothesised association to investigate TEST ONLY opportunity and measurement conditions [S001:claim, S002:result]

What theory cannot show. TEST ONLY: perception alone cannot explain observed performance Synthetic example; not an empirical model

RESEARCH / WRITING ROADMAP

01 thematic review

Paragraph purpose. TEST ONLY: Reported routines and observed learning outcomes warrant different kinds of claims.

Support / qualification. Both sources distinguish accounts from observations; the second also limits what a reported routine can establish. [S001, S002]

Evidence and warrant. S001, S002; A measure of experience cannot alone establish an independently observed outcome.

Congruence and transition. L1 → RQ1; After defining the constructs, examine explanations that could produce an apparent relationship.

02 thematic review

Paragraph purpose. TEST ONLY: Contextual opportunity is a plausible rival to an explanation centred only on learner routines.

Support / qualification. The authors retain opportunity and selection as alternatives; neither synthetic source establishes which mechanism operates. [S003, S004]

Evidence and warrant. S003, S004; Different mechanisms may be compatible with the same reported pattern.

Congruence and transition. L1 → RQ1; The rival accounts determine what the proposed design must be able to distinguish.

03 thematic review

Paragraph purpose. TEST ONLY: A proposed design needs separate measures and disconfirming cases to connect the argument to evidence.

Support / qualification. One source separates instruments; the other cautions that a correspondence would still need inference and context checks. [S005, S006]

Evidence and warrant. S005, S006; Construct distinctions require matching observation and interpretation strategies.

Congruence and transition. L1 → RQ1; Carry the qualified claims into a parsimonious framework and a feasible investigation.

reported study routines. Proposed routine interview code; Compare routine accounts across cases; disconfirming pattern: TEST ONLY: convergent independent evidence changes interpretation

observed learning outcomes. Proposed task observation code; Compare observed performance with accounts; disconfirming pattern: TEST ONLY: convergent independent evidence changes interpretation
