LIBRARY LEARNING

PROVISIONAL - EVIDENCE INCOMPLETE

TEST ONLY - SYNTHETIC SOURCES; NOT SCHOLARLY EVIDENCE

I. RESEARCH LOGIC

Problem. TEST ONLY: A routine account and an observed learning outcome answer different questions, yet a study can confuse their evidential roles.

Question. How should reported routines and observed outcomes be distinguished?

Provisional contribution. TEST ONLY only a bounded measurement refinement could remain

01. TEST ONLY: Reported routines and observed learning outcomes warrant different kinds of claims. (Fictional001, 2024; Fictional002, 2024)

02. TEST ONLY: Contextual opportunity is a plausible rival to an explanation centred only on learner routines. (Fictional003, 2024; Fictional004, 2024)

03. TEST ONLY: A proposed design needs separate measures and disconfirming cases to connect the argument to evidence. (Fictional005, 2024; Fictional006, 2024)

II. WHAT THE AUTHORS ACTUALLY ESTABLISH

10 included of 10 target; 10 full-text verified; 0 abstract only; 20 checked micro-excerpts.

01 Fictional001, 2024 [S001] - FULL TEXT

TEST ONLY: library learning evidence record 001

Source-informed explanation. For the urban reading club, the fictional authors distinguish learners' accounts of text rehearsal from independent delayed word recall. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic urban reading club design pairs a survey about text rehearsal with separate hypothetical task observations after 3 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the urban reading club example, an apparent relation between text rehearsal and delayed word recall remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The urban reading club illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between text rehearsal and delayed word recall; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for text rehearsal and delayed word recall, then test contextual rivals before making an effectiveness claim.

02 Fictional002, 2024 [S002] - FULL TEXT

TEST ONLY: library learning evidence record 002

Source-informed explanation. For the rural mathematics workshop, the fictional authors distinguish learners' accounts of number exercises from independent arithmetic accuracy. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic rural mathematics workshop design pairs a survey about number exercises with separate hypothetical task observations after 4 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the rural mathematics workshop example, an apparent relation between number exercises and arithmetic accuracy remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The rural mathematics workshop illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between number exercises and arithmetic accuracy; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for number exercises and arithmetic accuracy, then test contextual rivals before making an effectiveness claim.

03 Fictional003, 2024 [S003] - FULL TEXT

TEST ONLY: library learning evidence record 003

Source-informed explanation. For the bilingual science class, the fictional authors distinguish learners' accounts of diagram revision from independent concept explanation. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic bilingual science class design pairs a survey about diagram revision with separate hypothetical task observations after 5 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the bilingual science class example, an apparent relation between diagram revision and concept explanation remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The bilingual science class illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between diagram revision and concept explanation; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for diagram revision and concept explanation, then test contextual rivals before making an effectiveness claim.

04 Fictional004, 2024 [S004] - FULL TEXT

TEST ONLY: library learning evidence record 004

Source-informed explanation. For the adult evening seminar, the fictional authors distinguish learners' accounts of seminar preparation from independent argument reconstruction. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic adult evening seminar design pairs a survey about seminar preparation with separate hypothetical task observations after 6 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the adult evening seminar example, an apparent relation between seminar preparation and argument reconstruction remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The adult evening seminar illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between seminar preparation and argument reconstruction; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for seminar preparation and argument reconstruction, then test contextual rivals before making an effectiveness claim.

05 Fictional005, 2024 [S005] - FULL TEXT

TEST ONLY: library learning evidence record 005

Source-informed explanation. For the library enquiry group, the fictional authors distinguish learners' accounts of catalogue enquiries from independent search accuracy. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic library enquiry group design pairs a survey about catalogue enquiries with separate hypothetical task observations after 7 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the library enquiry group example, an apparent relation between catalogue enquiries and search accuracy remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The library enquiry group illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between catalogue enquiries and search accuracy; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for catalogue enquiries and search accuracy, then test contextual rivals before making an effectiveness claim.

06 Fictional006, 2024 [S006] - FULL TEXT

TEST ONLY: library learning evidence record 006

Source-informed explanation. For the primary geography lesson, the fictional authors distinguish learners' accounts of map practice from independent location recall. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic primary geography lesson design pairs a survey about map practice with separate hypothetical task observations after 8 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the primary geography lesson example, an apparent relation between map practice and location recall remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The primary geography lesson illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between map practice and location recall; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for map practice and location recall, then test contextual rivals before making an effectiveness claim.

07 Fictional007, 2024 [S007] - FULL TEXT

TEST ONLY: library learning evidence record 007

Source-informed explanation. For the secondary history course, the fictional authors distinguish learners' accounts of chronology revision from independent event sequencing. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic secondary history course design pairs a survey about chronology revision with separate hypothetical task observations after 9 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the secondary history course example, an apparent relation between chronology revision and event sequencing remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The secondary history course illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between chronology revision and event sequencing; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for chronology revision and event sequencing, then test contextual rivals before making an effectiveness claim.

08 Fictional008, 2024 [S008] - FULL TEXT

TEST ONLY: library learning evidence record 008

Source-informed explanation. For the distance writing module, the fictional authors distinguish learners' accounts of draft review from independent writing coherence. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic distance writing module design pairs a survey about draft review with separate hypothetical task observations after 10 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the distance writing module example, an apparent relation between draft review and writing coherence remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The distance writing module illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between draft review and writing coherence; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for draft review and writing coherence, then test contextual rivals before making an effectiveness claim.

09 Fictional009, 2024 [S009] - FULL TEXT

TEST ONLY: library learning evidence record 009

Source-informed explanation. For the vocational design studio, the fictional authors distinguish learners' accounts of prototype sketches from independent design accuracy. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic vocational design studio design pairs a survey about prototype sketches with separate hypothetical task observations after 11 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the vocational design studio example, an apparent relation between prototype sketches and design accuracy remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The vocational design studio illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between prototype sketches and design accuracy; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for prototype sketches and design accuracy, then test contextual rivals before making an effectiveness claim.

10 Fictional010, 2024 [S010] - FULL TEXT

TEST ONLY: library learning evidence record 010

Source-informed explanation. For the inclusive music workshop, the fictional authors distinguish learners' accounts of rhythm practice from independent rhythm recognition. Their measurement boundary separates reported study routines from observed learning outcomes. *(Synthetic section: claim)* The synthetic inclusive music workshop design pairs a survey about rhythm practice with separate hypothetical task observations after 12 days. Separate reported routines and task records illustrate evidence types without real data or recruitment. *(Synthetic section: method)*

Evidence and boundary (paraphrase). In the inclusive music workshop example, an apparent relation between rhythm practice and rhythm recognition remains illustrative rather than an observed effect. The authors reason that a reported routine cannot establish an observed outcome, so this invented comparison warrants no statistical or causal conclusion. *(Synthetic section: result)* The inclusive music workshop illustration contains no real participants, tested intervention or population finding. Recall, selection and contextual opportunity could alter the relation between rhythm practice and rhythm recognition; measurement differences prevent generalisability. *(Synthetic section: limitation)* **Author's original words:** *"reported routine cannot establish an observed outcome"* (Synthetic section: result). *"no generalisability"* (Synthetic section: limitation).

Our use of this source. Use separate measures for rhythm practice and rhythm recognition, then test contextual rivals before making an effectiveness claim.

https://example.test/library/10

III. ARGUMENT INTEGRATION + CLOSEST-STUDY CHALLENGE

01. Both sources distinguish accounts from observations; the second also limits what a reported routine can establish. (Fictional001, 2024; Fictional002, 2024). A measure of experience cannot alone establish an independently observed outcome.

Counterargument. TEST ONLY: selection or opportunity can explain reported differences; Synthetic only; no observed causal effects

Our synthesis. Separate the constructs before comparing their proposed relationship.

02. The authors retain opportunity and selection as alternatives; neither synthetic source establishes which mechanism operates. (Fictional003, 2024; Fictional004, 2024). Different mechanisms may be compatible with the same reported pattern.

Counterargument. TEST ONLY: selection or opportunity can explain reported differences; Synthetic only; no observed causal effects

Our synthesis. Compare rival explanations and seek negative cases rather than assuming a routine caused an outcome.

03. One source separates instruments; the other cautions that a correspondence would still need inference and context checks. (Fictional005, 2024; Fictional006, 2024). Construct distinctions require matching observation and interpretation strategies.

Counterargument. TEST ONLY: selection or opportunity can explain reported differences; Synthetic only; no observed causal effects

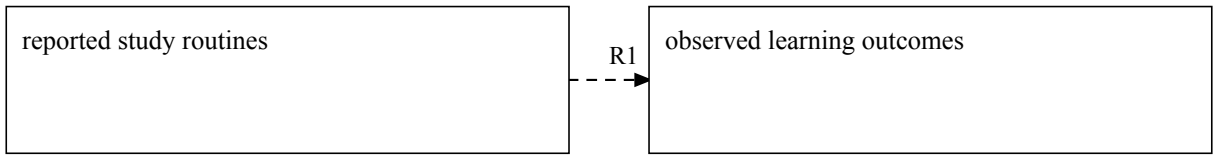

Our synthesis. Use distinct measures or codes, then test the limits of the proposed explanation.

Strongest closest-study challenge. Fictional001, 2024: TEST ONLY existing conceptual distinctions may already answer the question

What survives. TEST ONLY only a bounded measurement refinement could remain Bounded to searched sources and contexts; TEST ONLY generated corpus; no real search or novelty

IV. THEORETICAL / CONCEPTUAL FRAMEWORK + ROADMAP

Explanatory lens. TEST ONLY evidence-boundary lens: TEST ONLY primary measurement lens (Fictional001, 2024; Fictional002, 2024).

Solid: source-grounded links. Dashed: proposed or sensitising links. Arrows express the stated analytical direction, not demonstrated causal effects.

reported study routines. Accounts of repeated activity; a perceived practice, not measured attainment; TEST ONLY: reports are not observations (Fictional001, 2024; Fictional002, 2024).

observed learning outcomes. Performance documented independently of a routine account; TEST ONLY: reports are not observations (Fictional001, 2024; Fictional002, 2024).

Explanatory boundary. TEST ONLY: perception alone cannot explain observed performance Synthetic example; not an empirical model

Proposed observables and analysis. reported study routines: Proposed routine interview code, Compare routine accounts across cases; observed learning outcomes: Proposed task observation code, Compare observed performance with accounts

Writing step 1. After defining the constructs, examine explanations that could produce an apparent relationship. (Fictional001, 2024; Fictional002, 2024).

Writing step 2. The rival accounts determine what the proposed design must be able to distinguish. (Fictional003, 2024; Fictional004, 2024).

Writing step 3. Carry the qualified claims into a parsimonious framework and a feasible investigation. (Fictional005, 2024; Fictional006, 2024).

Next step. Proceed to the review only when primary readings and the closest-study challenge support its claims; otherwise narrow the question and resolve the missing sources.
